

# cap & share

cap the carbon,  
share the income

We need to make cuts in our carbon emissions.  
And we need to DO it, not just set targets.

How? There's a fair, simple way called Cap & Share,  
which does away with all the hassle. No rationing,  
and it's not a tax - in fact you get paid for it!

## Cap

Only the fossil fuel suppliers (instead of all companies or individuals) have to have permits. The permits allow fossil fuels **into** the economy. This **automatically** caps the emissions when these fuels are burnt.

## Share

The money from selling the permits is shared out equally to everyone in the country. Energy prices rise (as they must), but you get compensation. If you have a small carbon footprint, you'll come out **ahead**.

The message of C&S is that there are **simple** ways to **guarantee** we meet targets - and it won't cost money. So don't let anyone tell you it's too difficult.
